

Shifa Herbal Remedies

Online Store & Order Management Platform — Features, Roles & Workflows

About this document. A plain-language walkthrough of everything the Shifa platform does today — the customer storefront, the staff admin panel, the people (roles) who use it, and how an order moves from placement to delivery and settlement. Use it as a product overview for the client, the team, or a demo script.

1. Platform overview

Shifa is a complete direct-to-consumer commerce platform for a herbal-remedies business, built as two connected applications sharing one secure backend and database:

- **Storefront** — a fast, mobile-first Progressive Web App (installable, works partly offline) where customers browse products, place orders, pay, and track delivery.
- **Admin / OMS** — the staff control room: order management, packing, courier dispatch, money reconciliation, catalog, inventory, procurement, finance, reports and settings.

Both run on a single secure server with a shared MySQL database. Everything a customer does on the store appears instantly for staff on the admin panel, and vice-versa.

Bilingual (English / हिन्दी)

Mobile, tablet & desktop

Light & dark mode

GST-ready invoicing

Installable app (PWA)

2. Roles & who does what

Access is role-based — each staff member only sees the sections relevant to their job. This keeps the panel simple and protects sensitive money/customer data.

Role	Who	What they can do
Admin	Owner / manager	Full access: all orders, catalog, inventory, users, settings, finance, procurement, reports, audit log.
Salesperson	Tele-sales / counter staff	Create orders on behalf of customers (with the ability to override the price per line), view their own orders and reports.
Packing user	Warehouse / packing desk	Scan & pack approved orders, print shipping and internal labels + barcodes.
Accountant	Finance staff	Reconciliation (COD collection, loss claims), returns/refunds, expenses, profit & loss, reports, customers.
Customer	Shoppers on the storefront	Browse, wishlist, cart, checkout, pay, track orders, review products, manage their account & order history.

3. Customer storefront features

Discover & browse

- Product catalog with categories & collections, search, filters and sorting.
- Rich product pages with images, description, price/offer, stock awareness and related products.
- Verified customer **ratings & reviews** (moderated by admin).
- SEO-optimised: clean URLs, meta/OpenGraph tags, product structured data, sitemap — built to rank on Google.

Shop & buy

- **Wishlist** with a shareable public link, and a persistent **cart** that follows the customer across devices when logged in.

- Checkout with **pincode** → **city/state autofill**, live inline validation, and a delivery-date estimate.
- Payment options: **Cash on Delivery (COD)** and **online payment** (gateway-ready).
- **Coupons & offers** with live discount preview in the cart.
- Instant order confirmation by email and a WhatsApp handoff for support.

Track & engage

- Order tracking by order code, with a live order-status chat/timeline.
- Customer accounts with full order history & re-order.
- Branded transactional emails: welcome, order confirmed, shipped, delivered.
- Experience polish: cart drawer, add-to-cart animations, toasts, sticky mobile buy button, **dark mode**, **English/Hindi**, installable app with an offline page.

4. Admin / OMS features

Command centre

- **Dashboard** with live KPIs and charts (revenue trend, orders by status, top products/states) and a real-time activity feed that updates without refreshing.
- **Global search** and saved filter views.

Order operations

- **Orders** list with server-side pagination, sorting, filtering and bulk actions (approve, mark-packed, merged label PDF).
- **Approval queue** for reviewing and approving new orders.
- **New Order** entry for salespeople/admin, with a per-line **price override** and a screenshot upload.
- **Packing** scan station that generates shipping + internal labels and barcodes.
- **Returns / RTO** workflow: initiate return, capture reason, restock, track refund.

Money & catalog

- **Reconciliation** of COD collections and courier loss/damage claims.
- **Branded invoices** (plain & GST tax invoice) and **reports** (Excel / PDF / Vyapar export) in the Shifa theme.
- **Products** (with CSV bulk import), **inventory** with a stock-movement ledger & low-stock alerts, **coupons** and **review moderation**.

Procurement, finance & governance

- **Procurement**: suppliers & purchase orders; receiving goods automatically restocks inventory.
- **Finance**: expenses tracking and a Profit & Loss view (revenue vs costs vs expenses).
- **Customers / CRM**: lifetime value, order history, repeat-buyer flags.
- **Notifications centre** + bell, global **audit log** (who changed what, when).
- **Settings**: company identity & logo, GST config, invoice numbering, bank details, terms, tax slabs.
- **User management** with role assignment.

- **Scheduled daily sales-digest email** to the owner.

5. Customer journey (store flow)

```
Land on store → Browse / search / filter → Open product
  → Add to wishlist / cart → (optional) apply coupon
  → Checkout: enter details (pincode autofill)
  → Choose COD or Online payment
  → Place order → Instant confirmation (email + on-screen + WhatsApp)
  → Track order status → Delivered → Leave a review
```

A logged-in customer keeps their cart, wishlist and full order history across devices. A guest can still check out and track by order code.

6. Order lifecycle (admin flow)

Every order moves through a controlled state machine. Staff actions and courier updates advance the status; nothing skips a step, so the records always stay trustworthy.

```
PLACED
  | (admin/approval queue reviews)
  ▼
APPROVED → PACKED → DISPATCHED → OUT FOR DELIVERY → DELIVERED
  |                                     |
  |                                     ├── RTO (returned to origin)
  |                                     └── LOST IN TRANSIT (courier claim)
  └─ REJECTED / CANCELLED
```

Stage	What happens	Who
Placed	Customer (or salesperson) creates the order; confirmation sent.	Customer / Salesperson
Approved	Order reviewed in the approval queue and accepted.	Admin

Packed	Items scanned & packed; labels + barcode printed.	Packing user
Dispatched	Courier assigned, AWB generated, tracking + WhatsApp/email sent.	System / Admin
Out for delivery / Delivered	Courier webhooks update status; customer notified.	Courier → System
RTO / Lost	Return-to-origin or a loss claim is opened for reconciliation.	Accountant

7. COD & reconciliation flow

Delivered (COD) → Courier collects cash → Courier remits to business
 → Accountant records "received from courier" → Receivable settled
 Lost/Damaged → Loss claim raised → Claim tracked → Recovered / written-off

The reconciliation ledger always shows what money is still owed by the courier (COD not yet remitted) and the status of any loss claims — this feeds the Profit & Loss view.

8. Returns / RTO flow

Return requested / RTO → Reason captured → Goods received back
 → Inventory restocked → Refund tracked (if prepaid) → Return closed

9. Procurement & stock flow

Create Supplier → Raise Purchase Order (items, qty, unit cost)
→ Goods arrive → Receive PO (full or partial)
→ Inventory auto-restocked → Stock ledger updated → Expense recorded

Selling decrements stock automatically; receiving a PO increments it. Low-stock alerts warn before items run out.

10. Notifications (Email & WhatsApp)

Trigger	Email	WhatsApp
New account	Welcome email	—
Order placed	Order confirmation	Order confirmed
Dispatched	Shipped + tracking	Dispatched + tracking + COD amount
Out for delivery / Delivered	Delivered + review nudge	Status update
RTO / Lost	—	Status update
Daily (owner)	Sales digest	—

All emails use a branded HTML template (Shifa green/gold, logo, CTA button). WhatsApp uses pre-approved Meta templates. Both are designed to keep customers engaged and coming back.

11. Technology & security

- **Frontend:** Angular (two apps: storefront + admin), installable PWA, responsive, light/dark, EN/Hi.
- **Backend:** Java / Spring Boot REST API with a MySQL database and versioned schema migrations.
- **Security:** token-based (JWT) login, role-based access control, BCrypt-hashed passwords, per-role method-level authorization, audit logging.
- **Integrations (swappable):** payment gateway, courier API + webhooks, WhatsApp Business API, SMTP email — each runs in a safe "mock/sandbox" mode until real credentials are switched on.

- **Reliability:** nightly database backups, transactional outbox for guaranteed notification delivery, real-time dashboard via server-sent events.
- **Hosting:** single cloud VM with Nginx + the app + MySQL; HTTPS-ready; low running cost.
